

The diagram illustrates a protein-protein interaction network centered around BCL2. The network is composed of numerous nodes (proteins) and edges (interactions). The nodes are color-coded: red for strong interactions, blue for moderate interactions, and purple for weak interactions. The central hub is BCL2, which is connected to a large number of other proteins. Other prominent hubs include BAX, BCL2L1, MCL1, and BCL2L2. The network is organized into several clusters, with some proteins acting as bridges between different groups. The overall structure is highly interconnected, suggesting a complex regulatory network.
